## Winter Maintenance Checklist

Preventative maintenance is a great way to protect your generator investment. When storms roll through, your generator may need some additional preventative care.

Here are some steps you can take to ensure the **reliability** of your equipment by being prepared for the sleet, snow, freezing rain, and whatever else may come your way.

### Repairs and Maintenance

- ☐ Address any outstanding quotes for repairs from your generator service company
- ☐ Complete any necessary repairs to the cooling systems including coolant flushing and fresh antifreeze
- ☐ Make sure block heaters are plugged in and functional
- ☐ Make sure the diesel or propane tank is full
- ☐ Replace the battery if it needs replacement
  - Residential - every 3 years// Commercial – every 4 years
- ✓ If you have a residential preventative maintenance agreement with us, we'll replace your battery every 4th preventative maintenance visit at no extra charge.

### Generator Access

- ☐ Keep your generator clear of weeds, trees, debris, and snow
  - Allow at least 2' of clearance around the unit in every direction
- ☐ Lubricate door locks to prevent them from freezing up
- ☐ Indoor units located at ground level should have the inlet and outlet levers free and clear from snow

**For ultimate peace of mind, consider adding a 24/7 remote monitoring system to your residential or commercial generator system.**
